

Canada: The Killer H1N1 Vaccine

Michel Chossudovsky is a Canadian economist. He is a professor of economics at the University of Ottawa

A new development in the H1N1 Vaccine Saga is unfolding in Canada. The government is involved in a cover-up. Health authorities have called for the withdrawal of 170,000 (higher risk) doses of the vaccine produced by GlaxoSmithKline. What happened to the remaining 62,100 doses of the higher risk vaccine batch, which were used to vaccinate people in Manitoba? Has there been a followup regarding those people in Manitoba who received the higher risk H1N1 vaccine injection? What is the situation in other provinces in which the higher risk vaccine doses were distributed? The news reports have highlighted deaths resulting from the H1N1 flu, while obfuscating several recorded deaths resulting directly from the vaccine. These vaccine related deaths are occurring at the very outset of the vaccination program. **One Click Note:** People are dying and becoming disabled from GlaxoSmithKline's Pandemrix Swine Flu vaccine around the world. Will you or your child be one of them?

GlaxoSmithKline Withdraws Pandemrix Swine Flu Vaccine After Adverse Reactions And Deaths

Manitoba's Chief Medical Officer of Health,

Dr Joel Kettner

More than 100,000 doses of the H1N1 vaccine are being withdrawn across the country after Manitoba health officials announced Thursday they'd noticed a higher-than-usual number of allergic reactions. Vaccine manufacturer GlaxoSmithKline has asked several provinces to set aside the 170,000 doses

from the questionable batch. One person is believed to have died from an anaphylactic reaction following vaccination.
