

Canada Neuroscientist Slams H1N1 Vaccines

Researcher Dr Chris Shaw (PhD, UBC) says GlaxoSmithKline's product information leaflet for its H1N1 vaccine doesn't carry nearly enough safety data

Chris Shaw, a neuroscientist at the University of British Columbia, had his teenage son vaccinated with most of the recommended shots. But then he started studying some of the ingredients commonly found in vaccines. What he discovered caused him to go cold turkey on all shots for his six-year-old daughter. And that includes the vaccine for the H1N1 flu. There is no H1N1 vaccine safety data at all for several groups of people—pregnant women, people aged over 60, kids aged 10 to 17, and children under three. For kids three to nine years old, there is only “very limited” data. The product leaflet mentions a study in which the company injected the vaccine into pregnant rats. It found “an increased incidence of fetal malformations” and “delayed neurobehavioural maturation”. Also, the amount of mercury in the nonadjuvanted H1N1 vaccine does actually exceed the daily safety level for pregnant women. Shaw is also concerned about Canada's monitoring of the side effects of vaccinations, calling the system “flimsy”. H1N1 has about the same death rate as hernias. But we don't see scary front-page headlines for months on end about hernias.

USA Swine Flu Poll - Vaccine Unsafe

Nearly half of parents now don't intend to have their children vaccinated against the swine flu virus. Others continue to steer clear as a result of undiminished skepticism about the safety of the vaccine itself. Despite federal

reassurances, a third of Americans say they're not confident it's safe, much like the 30 percent who said so last month. And 66 percent of adults say they themselves don't plan to get vaccinated - up from last month. People who think the government has exaggerated the dangers of swine flu are only half as likely as others to plan to get vaccinated.

UK Parents Reject Mass Swine Flu Vaccine Campaign For Healthy Children

HEALTHY British children aged under five will be the latest group to receive the swine flu jab, it was announced yesterday. But many worried parents are expected to shun the vaccine over fears it is not safe. Jackie Fletcher, who runs Jabs, a support group for parents who believe their children have been affected by vaccines, said: *"Even though the Government says the drug is safe I do not believe they have sufficiently answered enough questions about it yet."* A recent survey found nearly half of Britons have doubts about the jab. One Click Note: David Cameron's Conservative Party wishes to extend the Swine Flu Vaccine campaign to all under-25s in Britain. This is a crystal clear indicator of the Conservative Party's links with the pharmaceutical industry, in particular Pandemrix vaccine manufacturer, GlaxoSmithKline. This comes with the Department of Health having massively over ordered the Swine Flu vaccines, now being rejected around the nation. This is very handy information to have prior to the oncoming General Election. Parent Power Rules.

My Boy's Agonising Death After Swine Flu Vaccine

Little Finlay loved the water, with a big smile on his face as he happily splashed around in the sink

Doctors reported the case to the Paul Ehrlich Institute as a possible result of

a deadly reaction to the virus inoculation. Mother Yvonne B. (34), a nurse for the elderly in Berlin, said: *“Finlay was born with a heart defect and damaged lungs. He had been operated on four times. Now he was waiting in hospital for a new heart and a new lung. He was doing quite well. We went out with him everyday. He played in the leaves and liked to watch birds.”* Doctors told the parents that the tot should be inoculated, mirroring the advice of the standing committee on vaccinations. In the afternoon the boy was vaccinated. On the next day he was still laughing and happily playing around in the leaves. But in the night, his condition suddenly worsened. He vomited and fluid got into his lung. The organ failed, and then so did his heart. The parents consented to an autopsy of their son. The Pathological Institute said yesterday they couldn't exclude a vaccine connection.
